Picture 1

Picture 2

NO	PARTS
①	Tool-head
②	Release button
③	Direction knob
④	1/4"Drive
⑤	Viewing window
⑥	Cursor
⑦	Scale
⑧	Knob

Picture 3

Picture 4

Torque range: 2~15Nm in 0.2Nm increment.

Bit sockets: Hex 3/4/5/6/8/10mm, T20/T25/T30, HEX 5mm*85mm (L).

6
+ 0.6
= 6.6 Nm

Picture 5

2 Instruction

- Set the required direction of rotation by turning the direction knob ③ (see picture 1).
- Press the release button ② to install (or release) the bit sockets on the 1/4" drive ④ (see picture 2).
- Set the required torque by turning the knob ⑧ as below example
 Set value 6.6Nm (4.87ft/lb)(1Nm=0.73756ft/lb).
 1. Pull the knob ⑧ and then turn clockwise until the reading "6" in the viewing window ⑤ is aligned with the cursor ⑥ , and the reading "0" on the scale ⑦ is aligned with the indicator on the handle (see picture 3).
 2. Continue to turn the knob ⑧ clockwise until the reading "0.6" on the scale ⑦ is aligned with the indicator on the handle. Release the knob ⑧ then torque 6.6Nm is set(6+0.6=6.6)(see picture 4).
- Tighten the wrench on bolt or nut until hearing "click" sound and tool-head ① bends (see picture 5), then release force immediately.

Notice :

- The torque wrench has been calibrated to be accurate to $\pm 4\%$.
- Before the first using or being unused for long time, be sure to repeat setting the torque to highest torque for 5-10 times so that the components within can be completely lubricated by the lubricant.
- Always set the torque to the lowest value when the wrench is not used.
- Keep the torque wrench clean and do not soak in any liquid.
- Do not keep apply force after the preset torque is reached or otherwise the work piece/the wrench may get damaged.
- Don't disassemble the torque wrench and please contact the local distributor if any problem or calibration demand.
- This is a high-precision measuring instrument and should not be used like a regular ratchet.

Torque wrench

CONVERSION TABLES

Foot Pounds (ft. lbs)	Kilo-gram Meters (Kgm or mkp)	Newton Meters (Nm)
